To Become Anonymous Online, we have to follow some steps and use tools. The most usual steps and tools are using VPN or proxy server, RDP, Virtual Machine, CCleaner, Mac Address changer, and browsing without saving history or cache. Firstly, using a VPN or proxy server must be paid because all the free ones contain fraud IP addresses that cannot work correctly to hide anyone's identity and location. Genuine IP address providers also play an essential role in hiding identity or working activities. Secondly, RPD also needs an actual IP address that provides extreme internet speed. It is mainly used for doing some specific work which is provided by some big organizations. Anyone can work without saving his or her working activities there, which is the primary advantage of using RDP. Thirdly, a Virtual Machine or virtual box or VM workstation is used in one's own pc to work with some temporary stuff. That is why anyone has not to do this temporary stuff on his or her main pc. Fourthly, CCleaner is used to clean anyone's browsing history and browser cache properly from the device, which is also used to be anonymous online. On the other hand, the DuckDuckGo browser can also be used for browsing, which does not save any history or cache when surfing the internet. Lastly, Mac address changers play a vital role in being anonymous online. Mac address is a unique identity for anyone's device to track. However, it is not easy to track the device when the mac address is changed.
